GENERAL AND PARTICULAR ABILITIES

- CE.1 Recognize and apply the fundamentals physical, chemical, biochemical, biological, physiological, mathematics and statistics necessary for the understanding and development of science and food technology

OBJECTIVES (EXPRESSED IN TERMS OF EXPECTED RESULTS OF THE TEACHING PROGRAMME)

At the end of this course the student is expected to be able to:

- Understand the essential facts, concepts, principles and basic theories of Biochemistry.
- Apply this knowledge to the resolution of issues and problems related to Biochemistry.
- Understanding the relationship between structure and function of biomolecules and the general structure of proteins and their biological functions.
- Knowing the structure of biological membranes and their selective permeability feature. Understand their role in signal transduction into the cell
- Learning the structure of genetic material and mechanisms of perpetuation and expression of the genome
- Knowing what the major metabolic pathways that occur in the human

DETAILED SUBJECT SYLLABUS

THEORETICAL PROGRAM

1. Introduction to the study of biochemistry. Characteristics of living matter. Overview of key biological constituents. Molecular organization of the cells. Production and consumption of energy metabolism. Transfer of genetic information.
2. Carbohydrates. Monosaccharides and derivatives. Oligosaccharides. Polysaccharides. Glycoproteins and proteoglycans.
3. Lipids. Simple lipids. Complex lipids. Isoprenoid compounds. Sterols
4. Liposoluble vitamins. Vitamins A, D, E and K.
5. Nucleotides and nucleic acids. Cyclic nucleotides.
6. Amino acids, peptides and proteins. Structural characteristics and biological functions
7. Protein structure. Secondary structures. Forces that stabilize the protein structure. Fibrous proteins. Collagen
8. Tertiary and quaternary structures of globular proteins. Forces involved in its stability. Structural and functional domains. Holoproteins and heteroproteins. Myoglobin and Hemoglobin
9. Enzymes. Features. Enzymatic Catalysis: activation energy, transition state, specificity and active site. Factors affecting the catalytic efficiency. Types of enzymatic catalysis. Enzyme cofactors. Metal ions. Coenzymes. Water-soluble vitamins.
10. Enzyme kinetics. Monosubstrate reactions. Hyperbolic kinetics: Michaelis-Menten equation. Enzyme inhibition.
11. Enzymatic regulation. Types of enzyme regulation. Allosteric regulation and regulation through covalent modification. Zymogens. Regulatory subunits. Isoenzymes.
12. Chemical organization of biological membranes. Transport mechanisms through membranes.
13. Communication between cells and tissues. Extracellular chemical messengers, hormones, neurotransmitters, growth factors and differentiation, cytokines and eicosanoids.
14. Signaling pathways. Receptors: agonist and antagonist ligands. Signal transduction. G protein-coupled receptors: adenylate cyclase systems and phospholipase C. Receptor tyrosine kinase.
15. Structure of nucleic acids. Denaturation and renaturation of nucleic acids. DNA supercoiling. Genetic organization.
16. DNA replication. Replication in prokaryotic and eukaryotic cells. DNA repair systems. Transposition.

17. Transcription in prokaryotic and eukaryotic cells. RNA polymerases. Promoters. Transcription factors. Post-transcriptional processing of RNA: splicing, base modifications, modifications of the 5' and modifications of the 3' end. Reverse transcription.
18. Translation. Genetic code. Role of tRNA as an adapter. Mechanism of activation of amino acids: aminoacyl-tRNA synthetases. Synthesis of the peptide chain: phase, energy balance, and fidelity of the process. Posttranslational modifications: Folding and maturation peptide chain. Protein degradation.
19. Regulation of gene expression in prokaryotes and eukaryotes. Levels of regulation of gene expression. Regulation of transcription. Regulation of processing pre-mRNAs. Regulation of mRNA degradation. Regulating the biosynthesis of the polypeptide chain. Epigenetics.
20. Proliferation and death of eukaryotic cells. Cell cycle. Regulation of cell cycle. Cellular Death by Apoptosis.

LABORATORY SESSIONS

1. Preparation of chromosomal DNA. Plasmid DNA purification. DNA electrophoresis.
2. Study of acetylcholinesterase activity. Location tissue. Effect of enzyme concentration on enzymatic activity
3. Determination of kinetic parameters of acetylcholinesterase
4. Colorimetric determination of protein. Lowry and Bradford methods

EVALUATION (EVALUATION TOOLS, EVALUATION CRITERIA , PERCENTAGE ON FINAL MARKS ETC.)

According to the Reglament for evaluation and assessment of students at the University of Granada, (May 20, 2013), students will be evaluated in a continuous system except for specifically statement made by the student. In this case, a single final exam will be held.

CONTINUOUS ASSESSMENT

It is based on the assessment of the student's work throughout the course and assesses the active participation in lectures and practical realization of proposed activities, seminars, tutorials, etc. The greatest percentage in evaluation lies on written examinations.

THEORY

Two similar written tests, one at mid-semester and one at the end of the semester will take place. Students who do not pass the first test will have the opportunity of repeating it at end semester.

All exams will be composed, partly, by multiple choice questions on basic contents of the subject and, partly, by various more specific questions by which synthesis capabilities and general comprehension of the subject by the student, will be assessed. The student must show abilities and capabilities in relating the different metabolic pathways studied.

To pass the subject it is necessary to obtain a minimum score of 5 points on 10, having sufficiently answered issues in both parts, which means reaching in each part a minimum score of 40%.

PRACTICE

Immediately after the completion of the internship, students will perform a written examination to demonstrate the achievement of the objectives. In case of not succeeding, the student will be called for a new examination. A final exam will take place at end semester.

To pass the course essential requirements will be:

1. To complete the practice in the lab, successfully passing the exam. In case of a student not performing lab practices a theoretical and practical examination is needed to be passed in the laboratory.
2. Succeed both written examinations, either at the time or at the end semester.
3. Relative percentage in the final grade for the different sections, will be:

Practice: 10%; Various activities: 10-20%; First exam: 35-40%; Second exam: 35-40%

FINAL EVALUATION EXCLUSIVELY

Students who have made the choice for this system and been admitted into it, during the first two weeks of semester, will have to pass a multiple choice examination (90% of score) and a practical exam (10% of score).

Additional Information

Additional information can be found on the website of the Department of Biochemistry and Molecular Biology II: <http://farmacia.ugr.es/BBM2/>
